Introduction

Documentation - Invisigal 3D model

Thank you for purchasing my model! Here is a quick how-to-use guide.

The model works perfectly on EEVEE

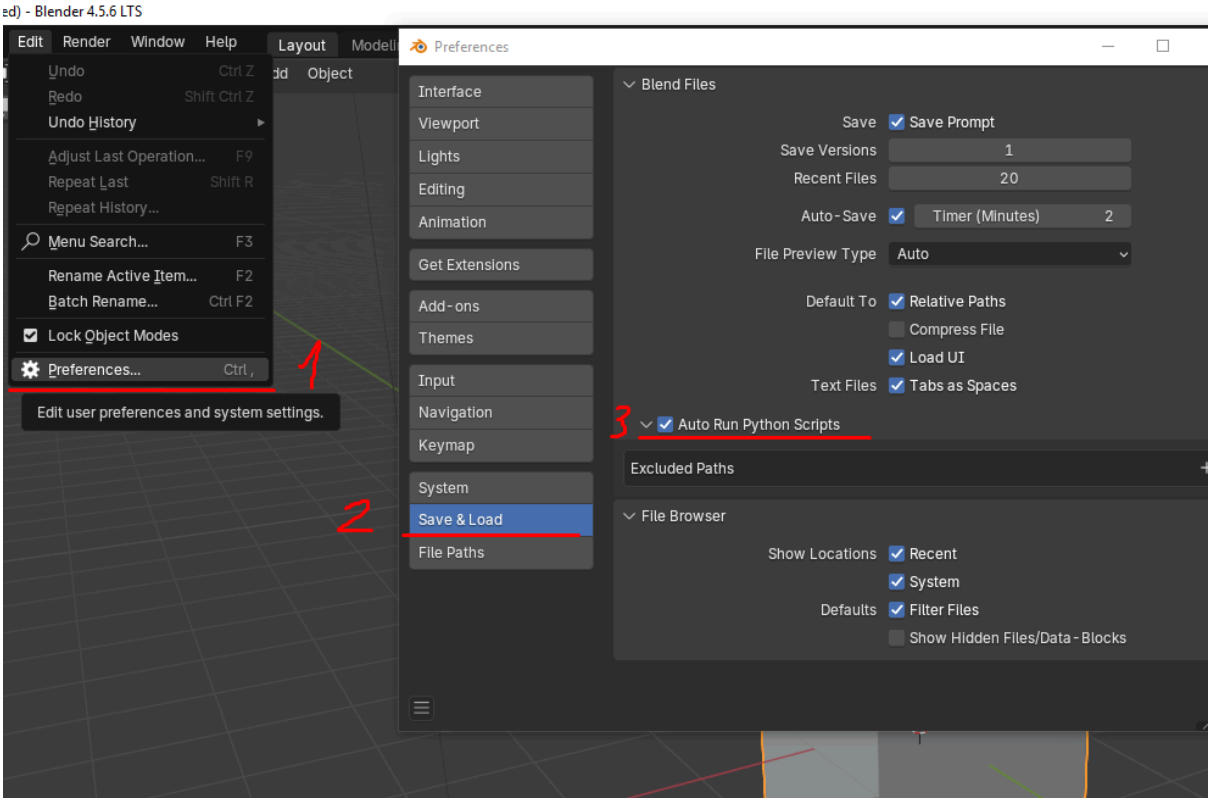

OUTFITS!
IMPLANTS
INVISIBILITY!

First steps

First of all make sure you are using Blender 4.2+ (the project was originally made on LTS 4.5.6 version so it's optimised exactly for this version of Blender).

I strongly recommend you to enable autorun python scripts inside of your Blender. You can find this option inside the **Edit tab / Preferences / Save and Load.**

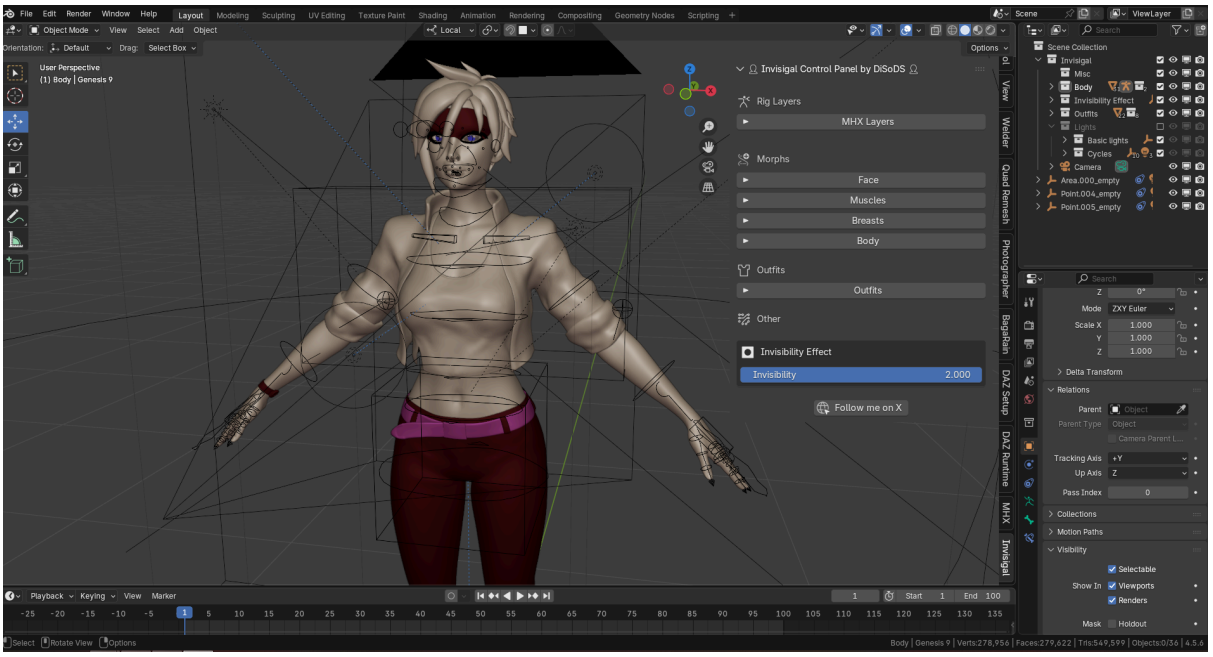

You have to do this step because my model uses a custom control menu which activates automatically every time when you're opening the project with Invisigal model. If you miss this step, probably you would have this window every time:

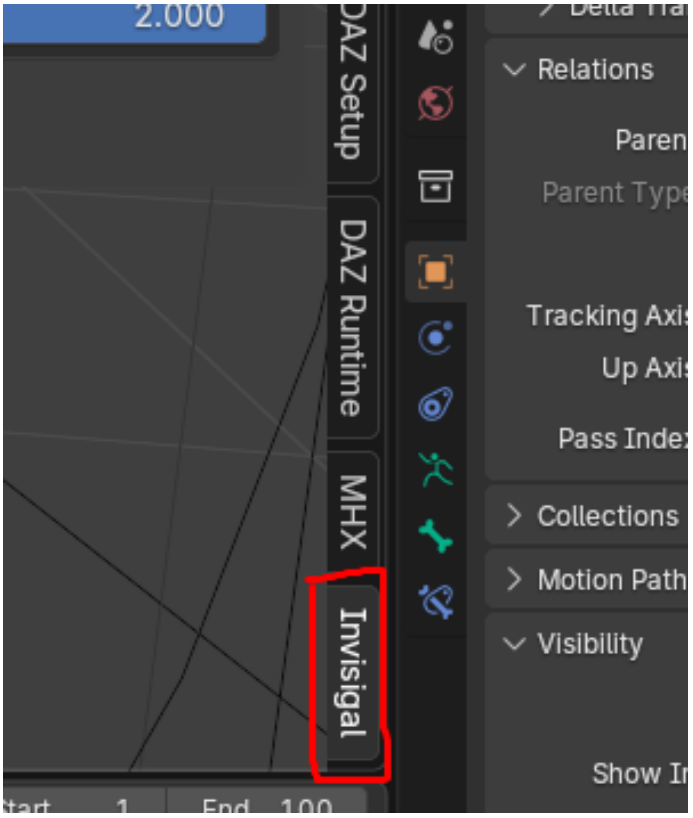

It's not crucial - just allow execution of this script. No worries, the script only adds a custom menu where you can play with character morphs and clothes.

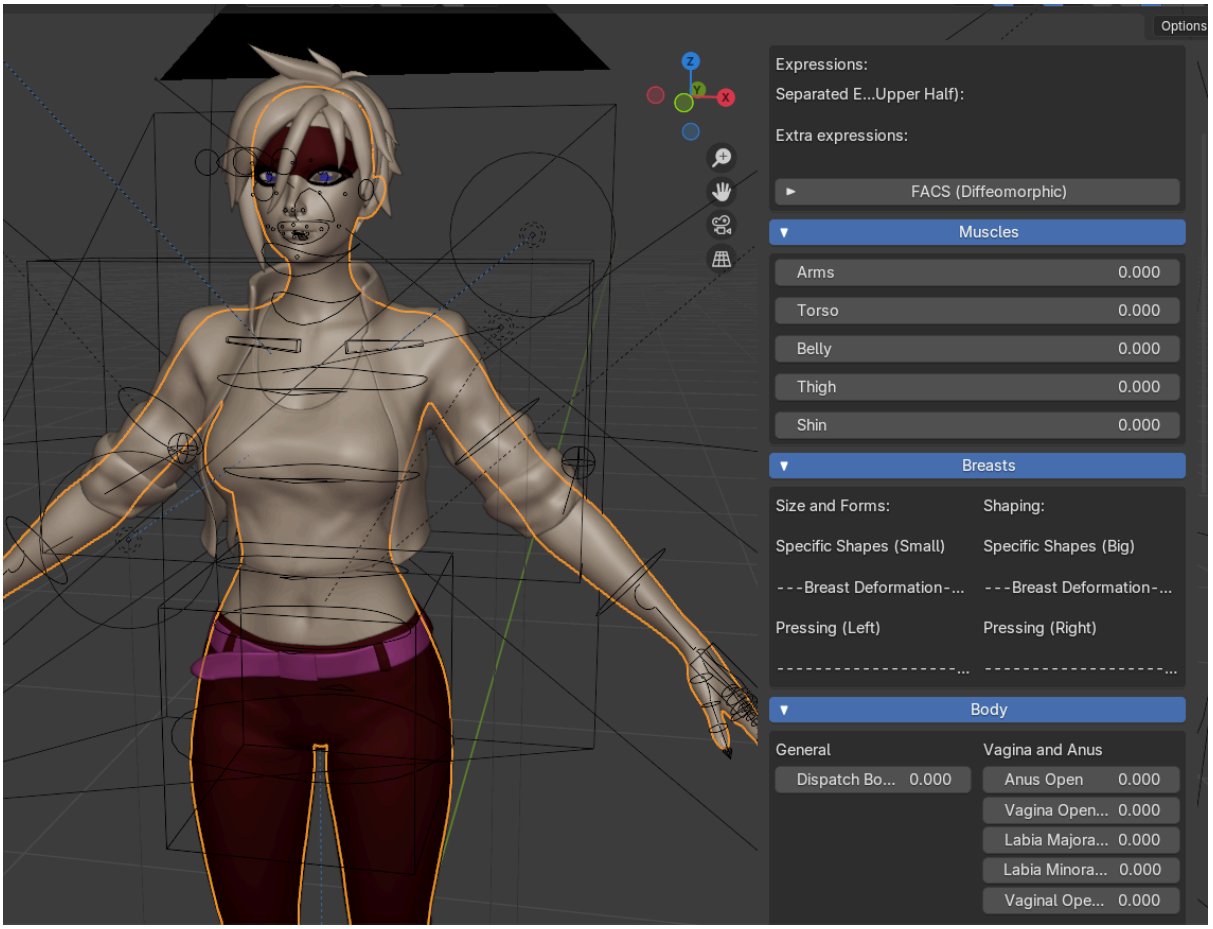

The project

When you open the project, you will see the **Invisigal model** along with the custom control panel. If you don’t see the panel tab — possibly due to having many addons installed — simply hover your cursor over the tab area and scroll until you find the **“Invisigal”** tab.

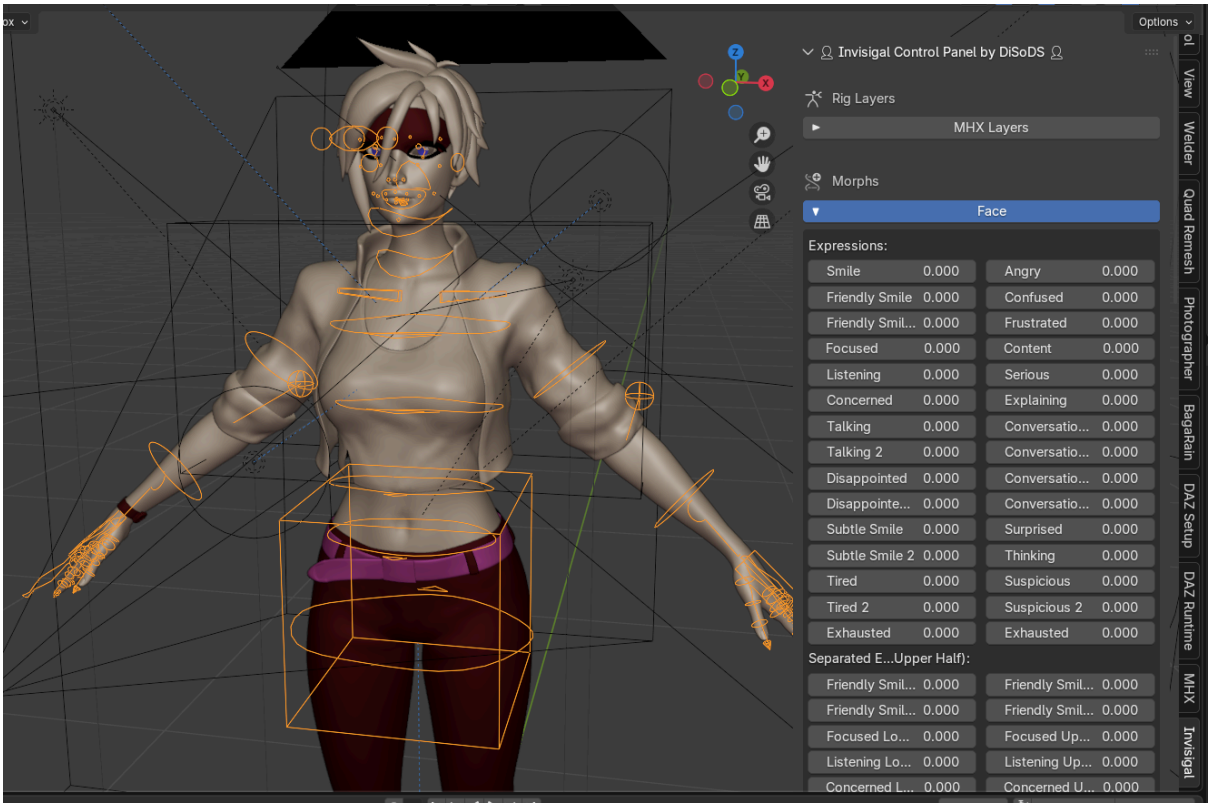

This custom menu is bound to the character rig. If suddenly the menu disappears or lose half of its functionality, just select character rig and everything come back to normal:

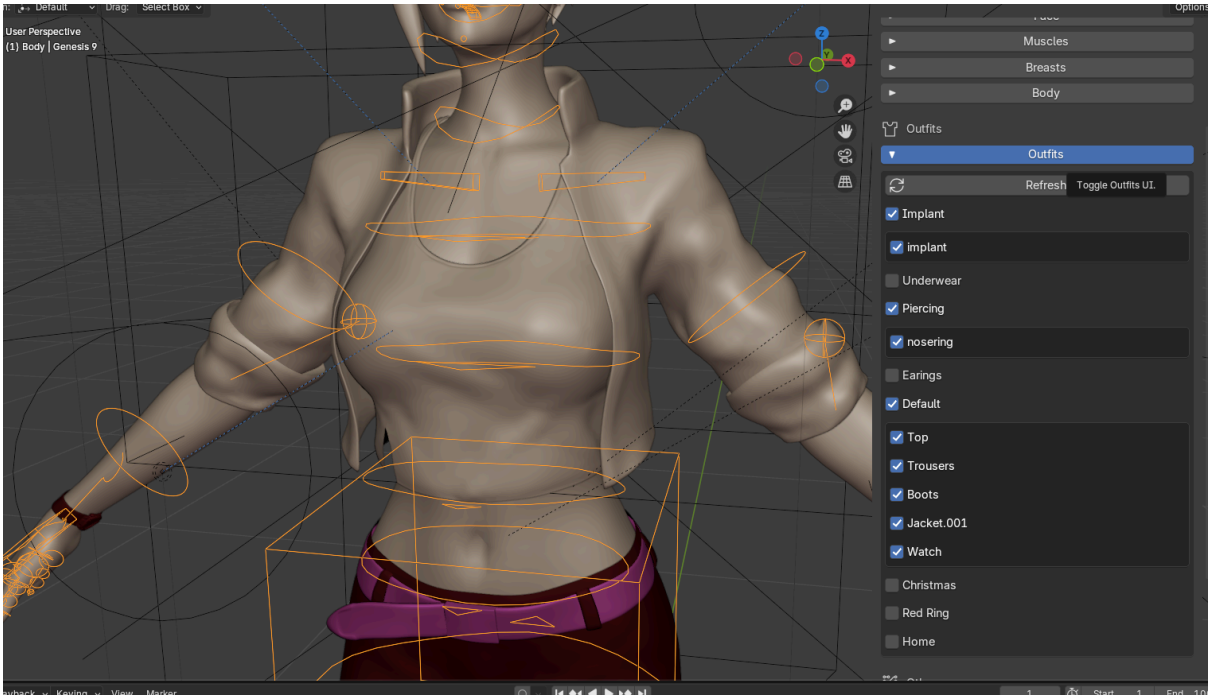

Broken

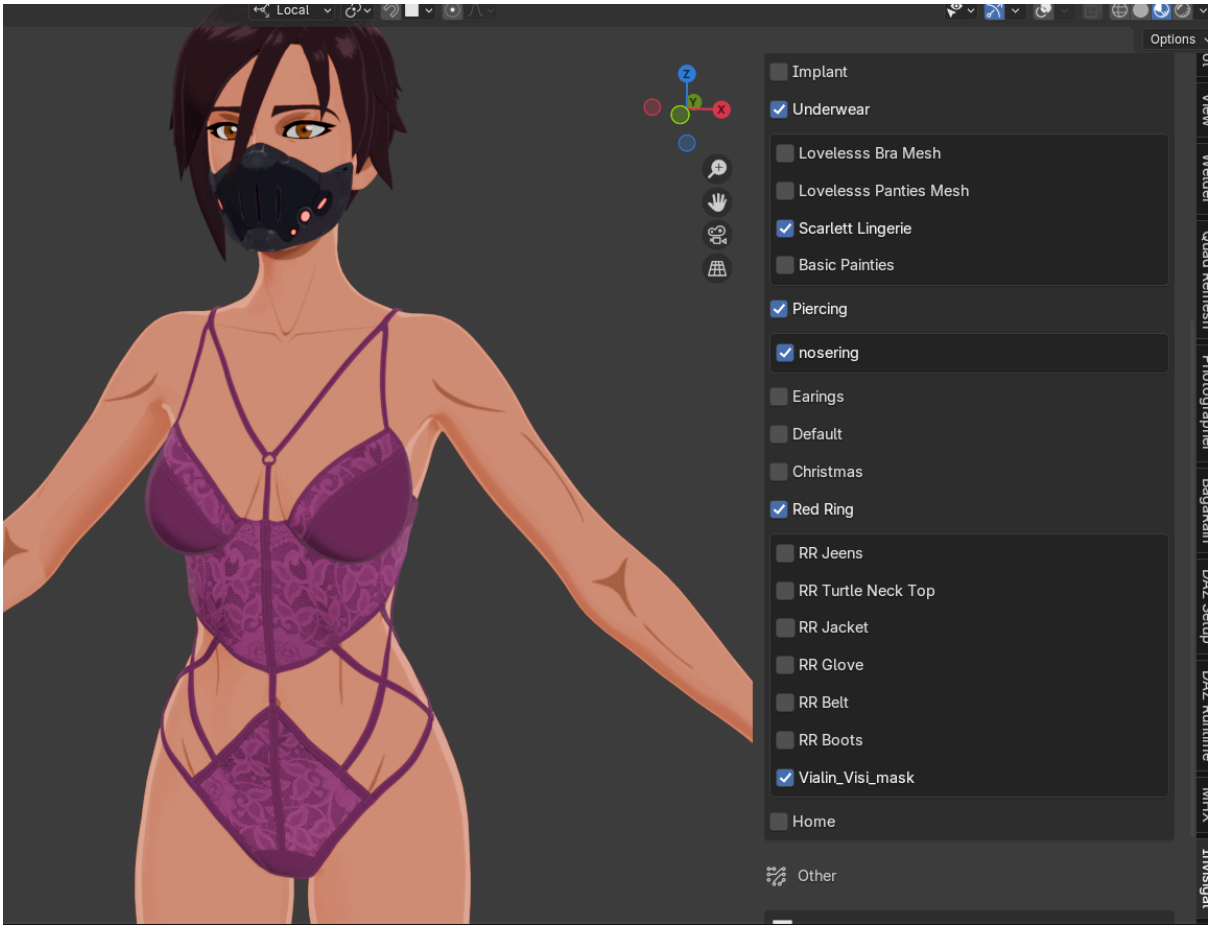

Fixed

Outfits. Feel free to combine different elements from outfits. Just select which parts you would like to see right now in the **“Outfits”** section of the custom menu.

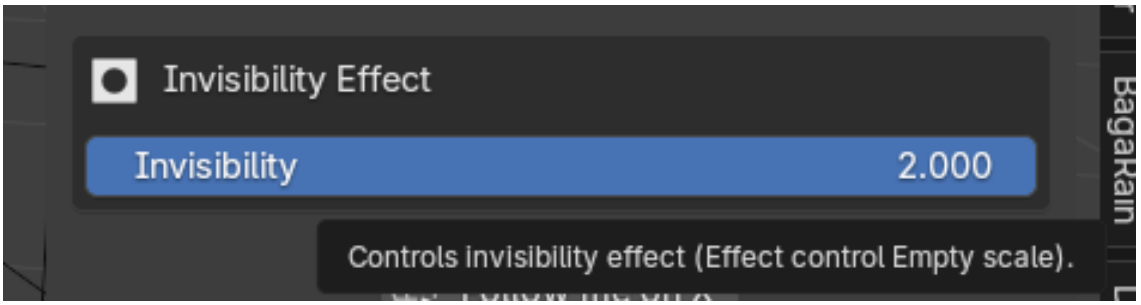

For example, I want to see lingerie and mask from the red ring set on my future render.. I’m selecting preferred and deselecting which parts I do not want to see on render:

Invisibility effect

Working via hybrid method (materials for character textures and geonodes for outlines). The invisibility effect works **ONLY ON EEVEE.** Use the **“invisibility”** slider in the custom menu to control strength of the effect.

Light system and shaders

Light system

Maybe the most complex part of this project. Let's start with lights.
The lights are separating on two collections: **"Basic lights"** and **"Cycles"**

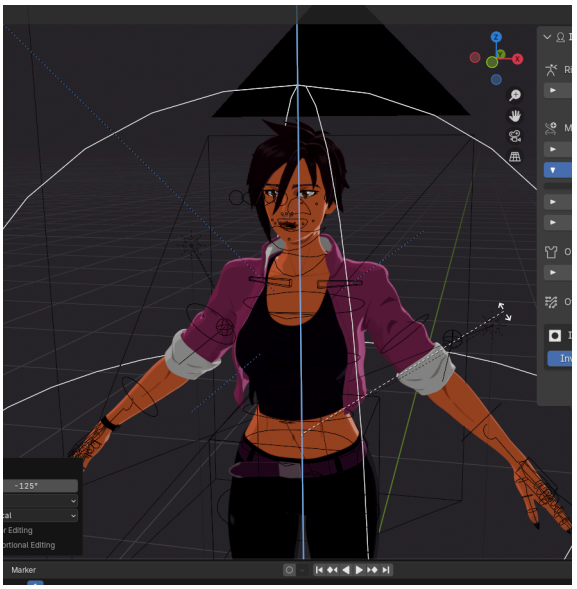

Basic Lights are the primary light sources required for the shaders to function correctly. They act as a general lighting system for the entire character.

All materials are built using an **RGB channel separation method**, and each light source in this collection is labeled according to its corresponding channel:

All these light sources are parented to **Light nest** - simple control. Just rotate it to change the light position. I usually rotate it with a Z coordinate.

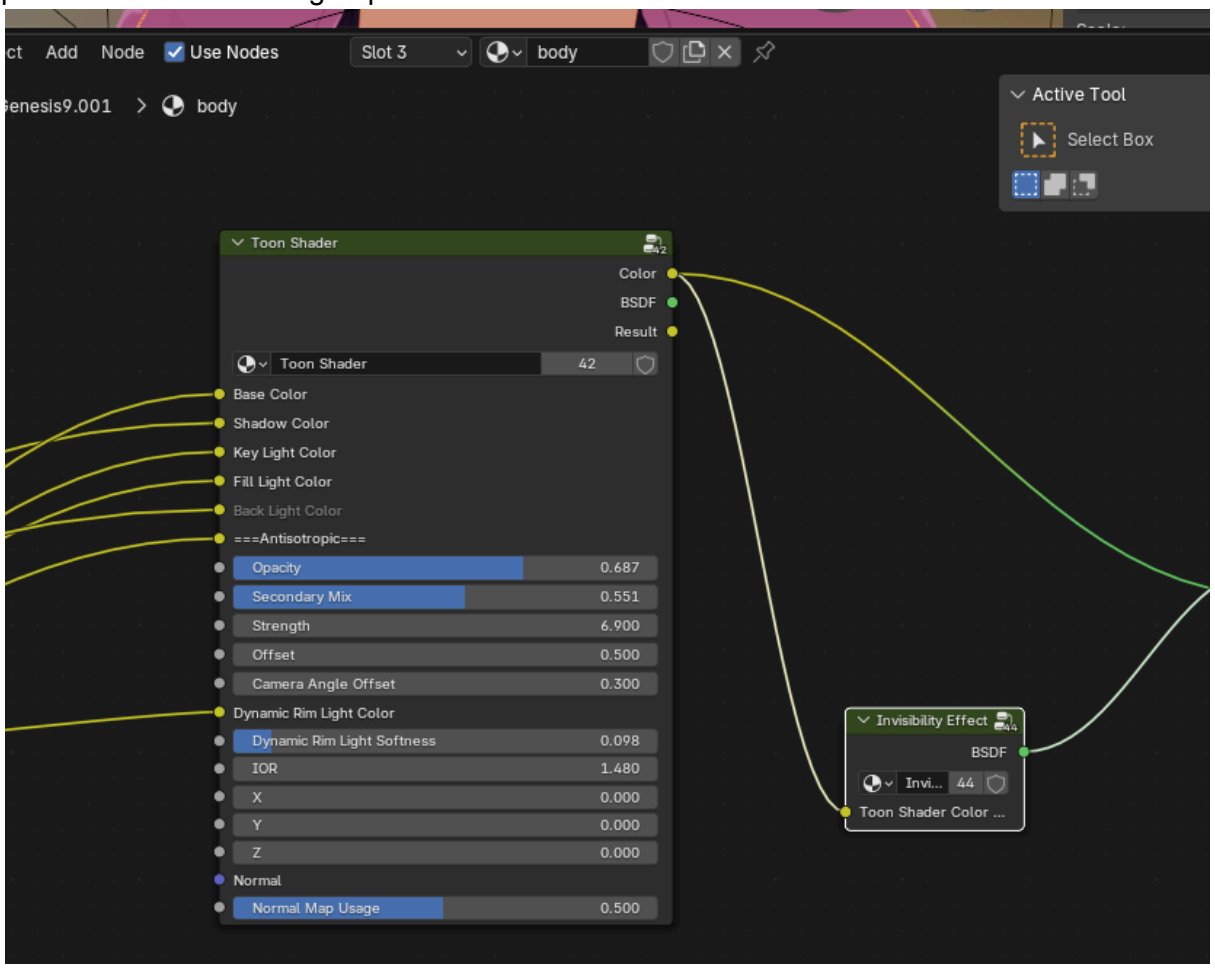

The second collection under **“Lights”** is called **“Cycles,”** but you can rename it however you prefer. This collection contains auxiliary light sources for the character and can also serve as the primary lighting setup for the entire scene.

Feel free to add any lights from your environment to this collection.

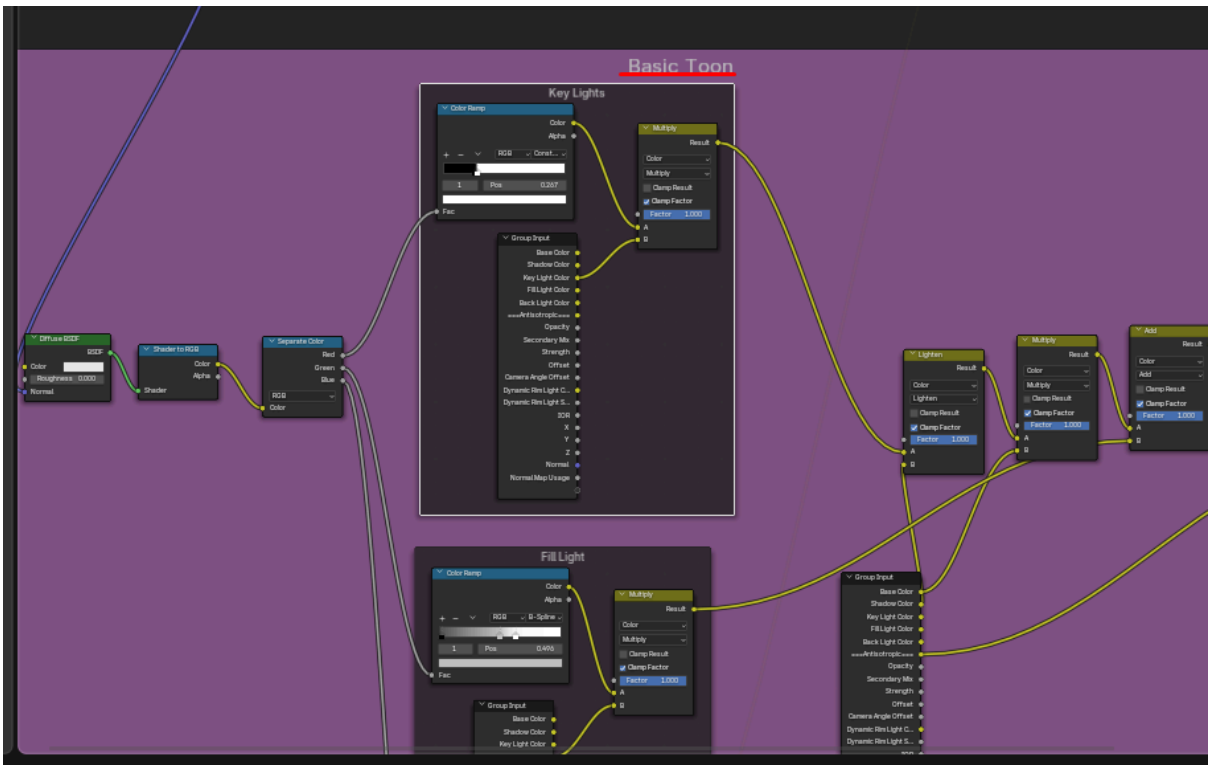

Materials

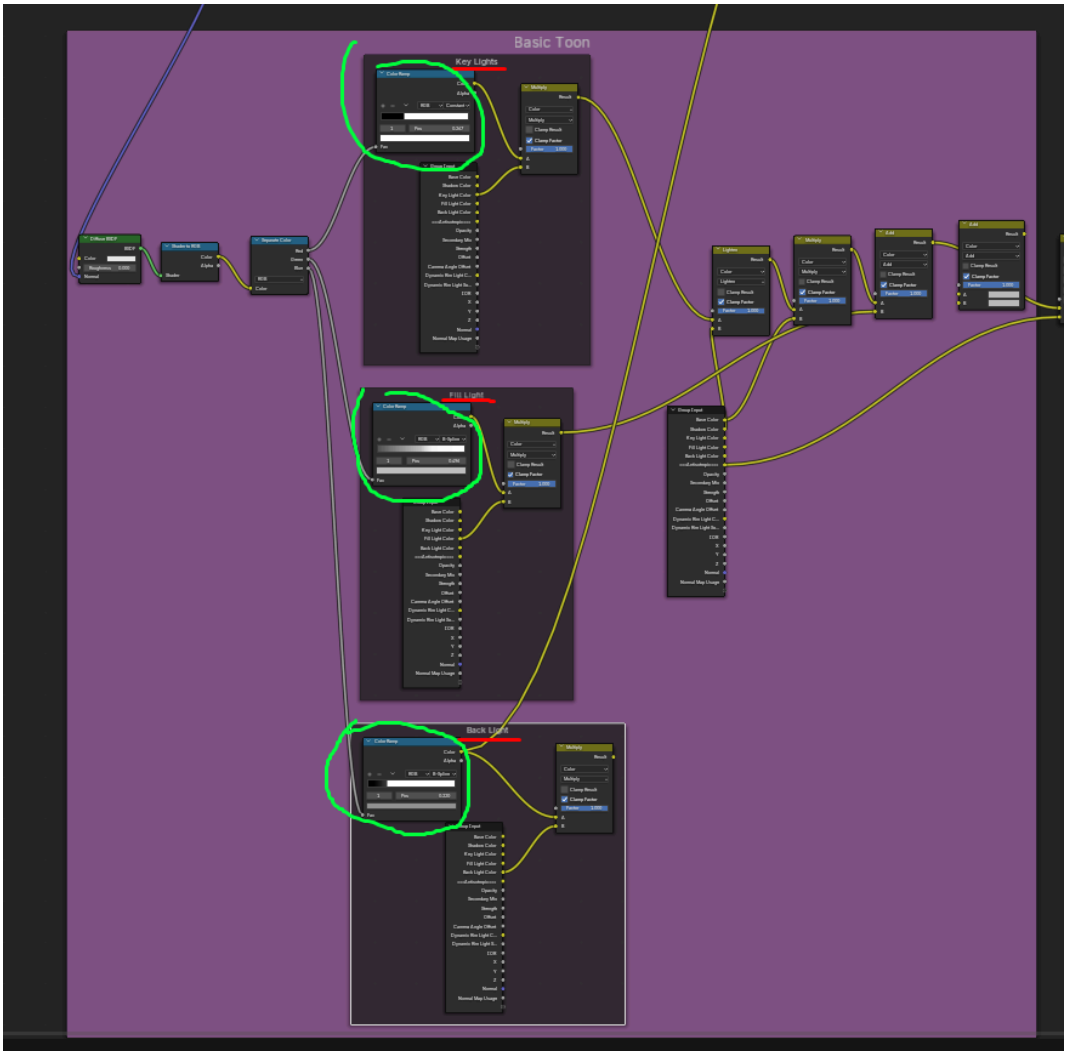

The main magic happening in the materials. They’re all different but contain one common par - Toon Shader nodegroup

This node group makes the character’s appearance much closer to the Dispatch style. You can open it by selecting the group and pressing **TAB**. It may look a bit messy but that’s normal

If you want to adjust the character’s shadows, locate this section inside the **Toon Shader** node group and experiment with the color ramps to achieve your desired result.

Basic Toon
Key Lights
Color Ramp

Diffuse BSDF
Shader to RGB
Separate Color
Lighten
Multiply
Add
Group Input

Basic Toon
Key Lights
Fill Light
Back Light

Each color ramp is driven by the red, green, and blue channels, as well as the light sources in the **Basic Lights** collection. You may occasionally need to adjust the settings to fix shading issues that can appear in certain situations.

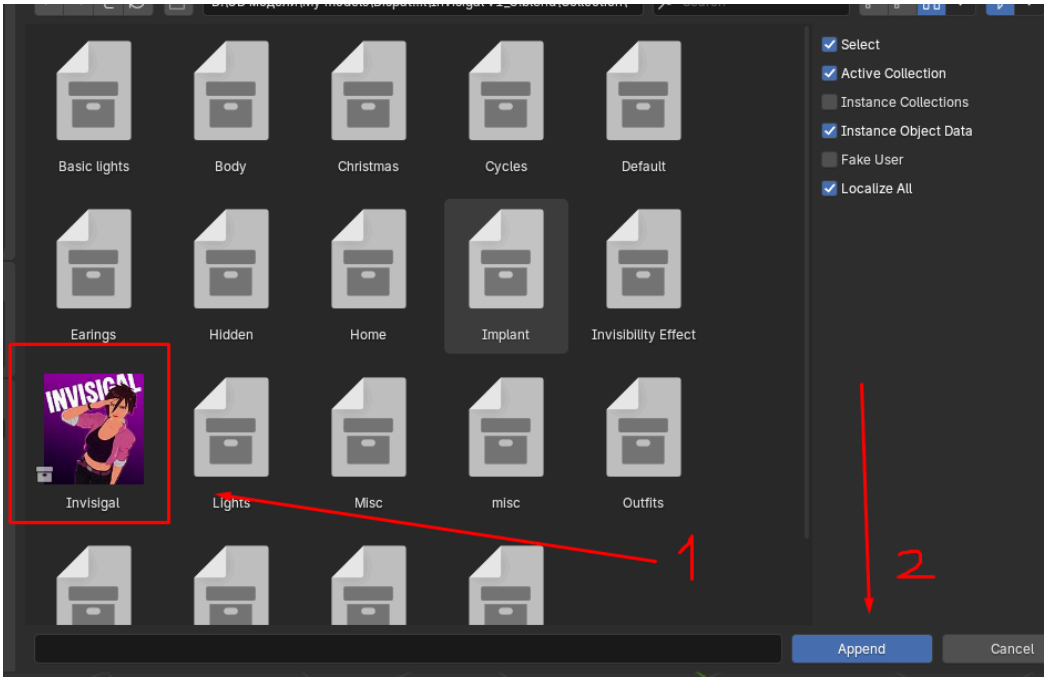

For example, in one of my artworks I modified the Fill Light color ramp to create a softer shadow transition. Feel free to experiment with these parameters to achieve the look you prefer!

Importing to your scene

Importing to your scene

Use the Append method to import my model to your project. Find Invisigal blend file, Collections folder and import Invisigal collection (that one with the picture).

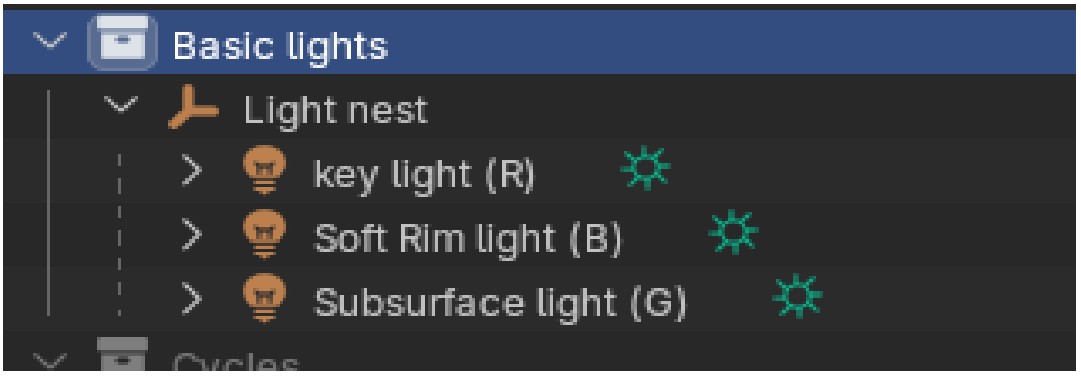

When you import my model to your scene you may noticed that scene light become too strange:

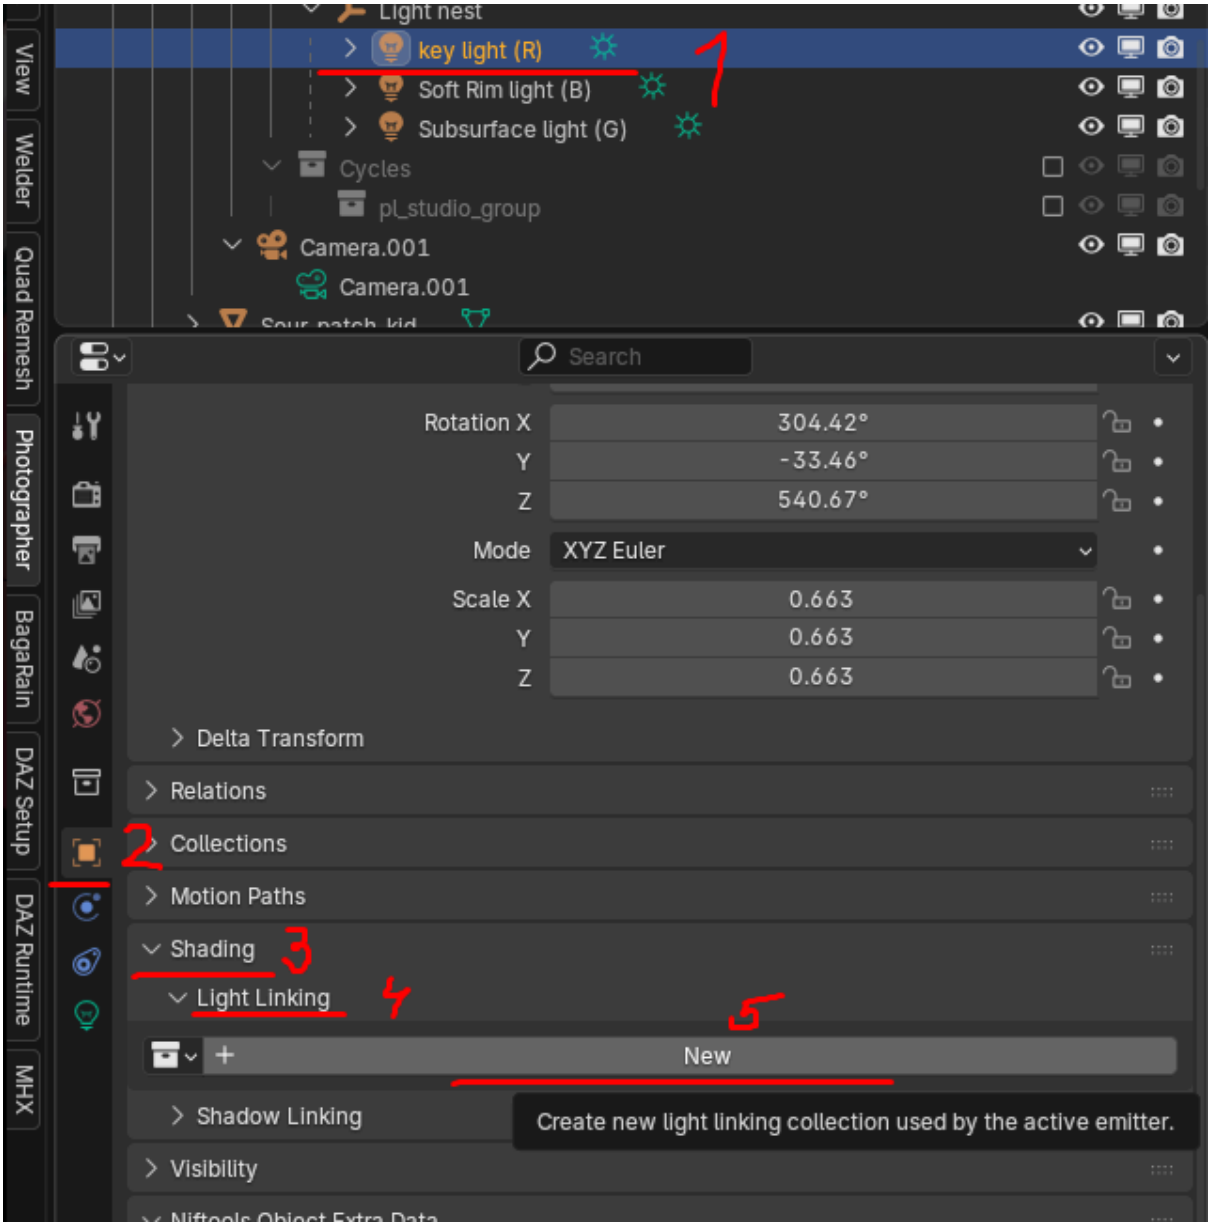

That’s happening because my model uses splitted RGB system of shading.

How to fix it?

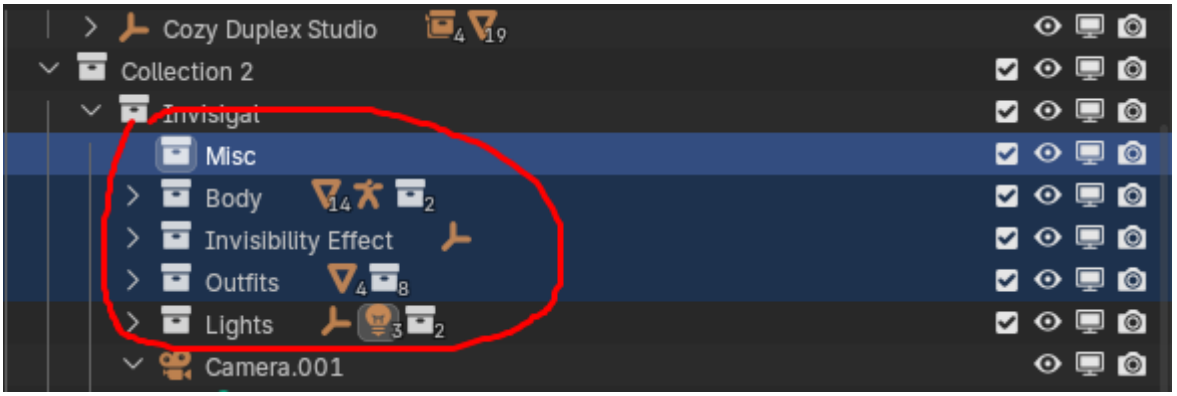

- You need to make Light linking for each light source in the **Basic lights** collection..

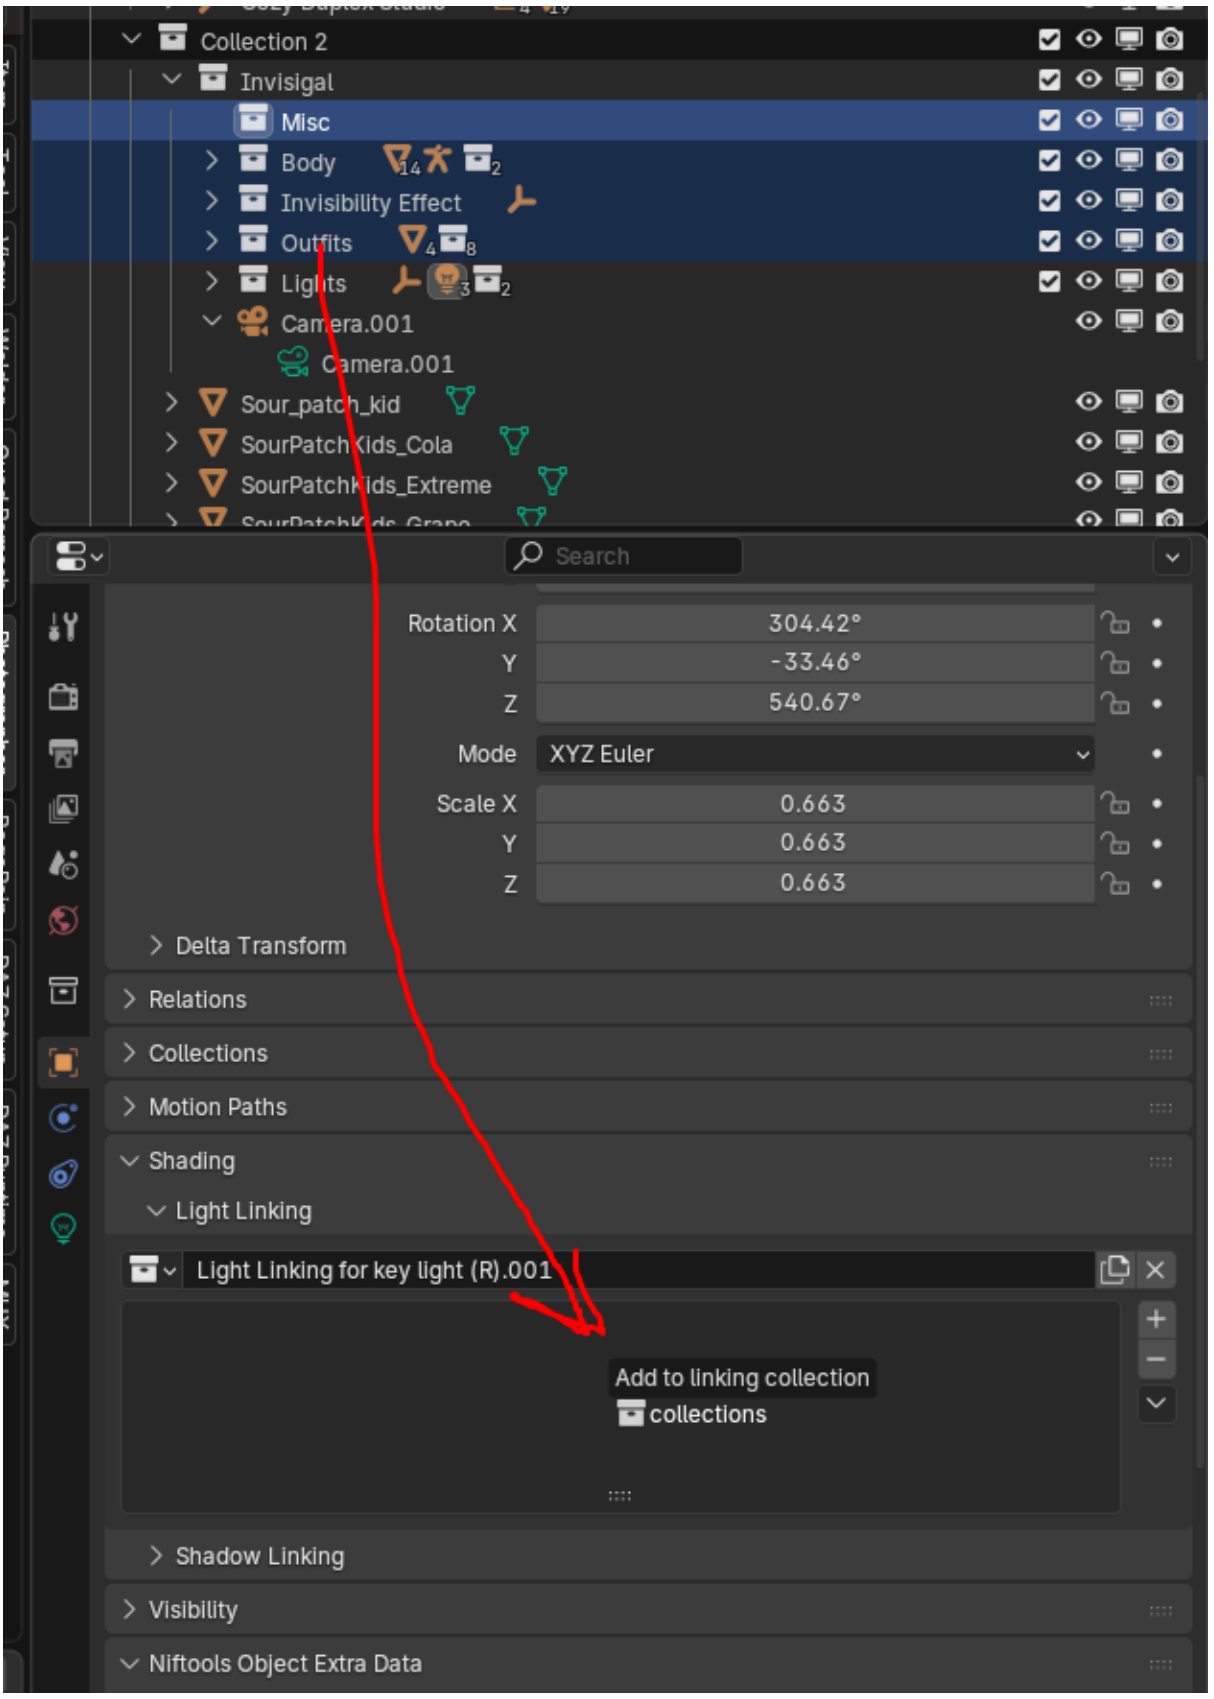

Select **key light**
Go to Object Properties tab. Shading/ Light Linking/ New

Select next collections: Misc, Body, Invisibility Effect, Outfits

Drag n drop them into Light Linking field

Okay, you **NEED TO DO THIS FOR ALL LIGHT SOURCES IN THE BASIC LIGHTS COLLECTION**

Done!

Troubleshooting

Troubleshooting

Invisibility effect doesn’t work on Cycles

- *Unfortunately, it works only on EEVEE*
-

Does the model work on a newer version of Blender?

- *It may but I’m not guaranteeing her stability in that case. Invisigal model was developed for Blender 4.5 LTS and has best compatibility with this version of the program.*

Something wrong happening with the model on Cycles

- *Unfortunately, this model is for EEVEE only. You could play with materials and force it to work on Cycles if you want. But all textures and shaders been developed for EEVEE*

Having lags on the viewport!

- *This may happen because of the custom control menu. Just hide it by pressing N button on your keyboard or switch the tab to another one. Items, for example.*
  The lags happen when you deselect the rig of the character but remain in the custom control panel. Don’t know why this is happening

I’ve imported Invisigal to my project but don't see Control Panel

- *Go to the Scripting tab in you blender project. The script may been imported but hasn't started automatically. Press the triangle button (Play) and the script must run.*

  If there is no any script, open an original blend file with Invisigal, go to the Scripting tab, copy everything from there by Ctrl + A, Ctrl+ C. Go to the Scripting tab in your project and paste the script here. Click the run button and done!
